

## Cod (Gadus morhua) in subdivisions 22-24, western Baltic stock (western Baltic Sea)

## ICES advice on fishing opportunities

ICES advises that when the EU multiannual plan (MAP) is applied, total catches in 2020 that correspond to the F ranges in the plan are between 5205 tonnes and 11006 tonnes. According to the MAP, catches higher than those corresponding to  $F_{MSY}$  (7245 tonnes) can only be taken under conditions specified in the MAP, whilst the entire range is considered precautionary when applying the ICES advice rule. Assuming recreational catches at recent average this implies commercial catches between 3065 tonnes and 5105 tonnes.

#### Stock development over time

The spawning-stock biomass (SSB) has been fluctuating around the limit reference point ( $B_{Lim}$ ) since 2009, but has increased in the last two years and is presently above  $B_{lim}$  and close to MSY  $B_{trigger}$ . The fishing mortality (F) is above  $F_{MSY}$ , although a large decrease in F has occured in later years. Recruitment (R) has been low since 1999; recruitment in 2017 (the 2016 year class) is estimated to be above average in this period. The recruitments in 2018 and 2019 (age 1) are the lowest in the time series.

Figure 1 Cod in subdivisions 22–24, western Baltic stock. Summary of the stock assessment. Recruitment, F, and SSB have confidence intervals (95%) in the plot. The EU landing obligation entered into force in 2015; therefore, BMS landings (fish below the minimum conservation reference size [MCRS]) have been included since 2017.

# Stock and exploitation status

ICES assesses that fishing pressure on the stock is above  $F_{MSY}$  and below  $F_{pa}$  and  $F_{lim}$ ; while spawning stock size is below MSY  $B_{trigger}$  and between  $B_{pa}$  and  $B_{lim}$ .

**Table 1** Cod in subdivisions 22–24, western Baltic stock. State of the stock and fishery relative to reference points.

#### **Catch scenarios**

**Table 2** Cod in subdivisions 22–24, western Baltic stock. Assumptions made for the interim year and in the forecast. Weights are in tonnes. Recruitment is in thousands.

Variable	Value	Notes
F <sub>ages 3-5</sub> (2019)	0.33	Based on catch constraint in 2019
SSB (2020)	29613	Based on catch constraint in 2019
R <sub>age 1</sub> (2019)	2226	From the assessment
R <sub>age 1</sub> (2020)	11659	Sampled from the last ten years*
R <sub>age 1</sub> (2021)	11622	Sampled from the last ten years*
Total catch (2019)	7988	Commercial + recreational catches.
Commercial catches (2019)	5848	Calculated as the 2019 TAC (9515 tonnes) plus an assumed discard ratio as in 2018 (4.2%), and accounting for the proportion of western Baltic cod in commercial catches in subdivisions 22–24 in 2018 (59%).
Recreational catches (2019)	2140	Average over 3 years (2016–2018)

<sup>\*</sup> Recruitment is randomly resampled from the last ten years' assessment estimates and the median of these random draws is used. This will vary slightly every time this is done.

<sup>\*</sup> Includes commercial and recreational catch.

Last year's estimation of the large 2016 year class has been revised down by 54%. This year class is the most important year class contributing to the catch and the revised estimate is largely responsible for the 52% decrease in the 2020 catch advice.

<sup>\*\*</sup> EU Multi-Annual Plan for the Baltic Sea (EU, 2016a).

<sup>\*\*\*</sup> SSB 2021 relative to SSB 2020.

<sup>^</sup> Total catch in 2020 relative to total catch corresponding to the advice for 2019 (15 021 t, MAP F<sub>MSY</sub>), including commercial and recreational catch.

 $<sup>^{\</sup>Lambda}$  Total catch in 2020 relative to total catch corresponding to the advice for 2019 for  $F_{MSY\ lower}$  (9094 t, MAP  $F_{MSY\ lower}$ ), including commercial and recreational catch.

#### Basis of the advice

**Table 4** Cod in subdivisions 22–24, western Baltic stock. The basis of the advice.

Advice basis	EU Baltic multiannual plan.						
Management plan	The EU multiannual plan (MAP) in place for stocks in the Baltic Sea includes cod (EU, 2016a). The advice,						
ivialiagement plan	pased on the F <sub>MSY</sub> ranges, is considered precautionary.						

#### Quality of the assessment

The estimate of the abundance of the 2016 year class has been revised significantly downwards in the updated assessment. The SSB development is very dependent on this year class (because the younger and older year classes are very low in abundance). A survey observation of the 2016 year class in 2018 was lower than expected, which explains the downward revision in SSB.

In 2018 the recreational catches included in the stock assessment constituted 30% of the total catches. The uncertainty around recreational catches is considered higher than in commercial catches. In addition, the catches in the recreational fishery are difficult to quantify in the intermediate year. It is also difficult to partition catches between commercial and recreational in the forecast.

In Subdivision 24 catches of cod are a mixture of eastern and western Baltic cod stocks, which is variable temporally and spatially and over size groups. A method to split the catches into the two stocks is applied each year which is based on data most years but which is also interpolated for years with no observations. This introduces uncertainty in the allocation of catches to the stock.

# Issues relevant for the advice

The reference points were re-estimated and changed at the stock benchmark in 2019 (ICES, 2019a).  $B_{lim}$  was revised downwards from 27 400 t to 14 500 t (47%), based on new information on the productivity of the stock at low biomasses.  $F_{MSY}$  and the lower and upper range were also re-estimated and the ranges narrowed. In this case there was no change to  $F_{MSY}$  (0.26), but the  $F_{MSY}$  lower is changed from 0.15 to 0.18, and  $F_{MSY}$  upper is changed from 0.45 to 0.43.

The increase of SSB in the forecast is mainly due to one strong year class (the 2016 year class). Fishing mortality in 2018 was still above  $F_{MSY}$ . The 2016 year class will account for the majority of the predicted catches in 2020 (72%) and SSB in 2021 (71%) (Figure 3). Additionally, the 2017 and 2018 year classes are historically low. If no stronger year classes occur in the coming years this will lead to a rapid decline of the stock. ICES therefore suggests to use the  $F_{MSY lower}$  value in the MAP when setting the TAC.

The SSB in 2020 is predicted to be above MSY  $B_{trigger}$ . In this situation, catch scenarios applicable under the MAP correspond to fishing mortalities between  $F_{lower}$  and  $F_{upper}$ . However, according to the MAP, catches corresponding to F higher than  $F_{MSY}$  can only be taken under conditions specified in the MAP.

Figure 3 Cod in subdivisions 22–24, western Baltic stock. Relative predicted distribution of year classes in the yield 2020 and spawning-stock biomass 2021.

Landings of fish below the minimum conservation reference size (MCRS, 35 cm) are very low in the management area (24 t below minimum size [BMS] reported in 2018). Discarding still takes place despite the fact that the landing obligation has been in place since 2015. The estimated amount of discards is 157 tonnes in 2018 (approximately 4.2%), based on observer data. ICES understands that this is not in accordance with the current regulations.

A spawning closure was introduced in 2016 (no directed cod fishing in February and March; EU, 2015, 2016b, 2017) and covered the peak spawning time; between 2016 and 2018 both a very large and a historically low recruitment were produced with a similar spawning stock size (Eero *et al.*, 2019). The span of years implemented for the closure was too short to evaluate its impact. In 2019 no spawning closure was implemented.

A mixture of eastern (EB) and western Baltic (WB) cod stocks is caught in the western Baltic management area (subdivisions 22–24). The assessment and this advice is for the western Baltic cod stock.

Recreational catches of cod in the western Baltic management area are considered to consist exclusively of WB cod. A bag-limit was introduced for the first time in 2017 (EU, 2016b) due to the poor stock status and this has lead (*inter alia*) to a drop in the recreational catches in 2017 and 2018 (1315 tonnes and 1600 tonnes, respectively). For 2019 the bag limit has been increased, from 5 to 7 fish per day per angler. The impact on the recreational catches in 2019 is unknown and the recreational catch value used for the intermediate year (2140 t) is based on a 3-year mean. The recreational catch in 2020 will depend on a management decision on the regulations for the recreational fishery. In the absence of other information the recreational catch assumed in the forecast has been kept constant.

To derive a management area-based total for commercial cod catch for the western and eastern Baltic areas (subdivisions 22–24 and 25–32) in line with ICES advice for the two cod stocks, ICES considers that the following issues should be taken into account:

- 1. The distribution area of the WB cod stock is subdivisions 22–24. The proportions of the WB cod stock commercial catch taken in subdivisions 22–23 and Subdivision 24 have been quite stable since 1994, amounting to 76% and 24%, respectively, on average in the most recent three years (Table 6).
- 2. The distribution area of the EB cod stock is subdivisions 24 and 25–32.
- 3. Commercial fishing in subdivisions 22–23 will provide a catch of the WB cod stock only.
- 4. Commercial fishing in subdivisions 25–32 will provide a catch of the EB cod stock only.
- 5. Commercial fishing in Subdivision 24 will provide a mixed catch of the EB and WB cod stocks. In the most recent three years, the ratio EB cod / WB cod commercial catch in Subdivision 24 has been 2.90 (Table 6).
- 6. In an area that includes two stocks of a species, the species TAC should be set such that the risk of overexploitation of the weakest stock is minimized.

The European Commission has requested ICES to provide information on catch opportunities by management area consistent with the stock advice, assuming a *status quo* distribution of the fisheries on subareas and stocks (option A in Table 5). There could be other allocation schemes, but such schemes are not known to ICES.

One example (Option A in Table 5) assumes that the geographical distribution of the commercial catch in 2020 remains as outlined in point 1 above and with average recreational catch in 2020, in which case the distribution of a commercial catch of 5105 t of WB cod will be 3880 t in subdivisions 22–23 and 1225 t in Subdivision 24. However, catches in Subdivision 24 should be zero in order to comply with the zero catch advised for EB cod. With a *status quo* effort in subdivisions 22–23, this would result in a TAC of 3880 t for the western management area which can only be fished in subdivisions 22–23. Alternatively, the implied commercial catch (5105 t) could be taken entirely in subdivisions 22–23. This would represent an increase of effort in this area which is considered the main spawning grounds for WB cod. This may negatively affect the spawning success of WB cod due to disturbance (though the effects on recruitment cannot be quanitified). Given this circumstance the reintroduction of a temporal fishery closure during spawning time could be considered.

Option B (Table 5) assumes that the geographical distribution of the commercial catch in 2020 remains as outlined in point 1 above and with average recreational catch in 2020, which means the distribution of a commercial catch of 5105 t of WB cod will be 3880 t in subdivisions 22–23 and 1225 t in Subdivision 24. Under these circumstances the additional amount of EB cod fished in Subdivision 24 is estimated to be 3555 t, assuming the same ratio between EB cod and WB cod as observed on average during 2016–2018 in the commercial catches (i.e. 2.90, see point 5 above). This would result in a TAC of 8660 t for the western management area which could be taken across the entire western Baltic management area. This option is not in line with the catch advice for EB cod.

Figure 4 provides a graphic presentation of how to arrive at area-based TACs from the ICES stock advice.

Figure 4 Cod in subdivisions 22–24, western Baltic cod. Illustration of calculations to obtain area TACs for western and eastern Baltic cod from ICES stock-based catch advice, taking into account stock mixing in Subdivision 24 and recreational catches for the western stock.

Table 5 Cod in subdivisions 22–24, western Baltic stock. The scenarios illustrate the implications of zero catch advice for eastern Baltic cod on the commercial catch by management area, assuming a recreational catch of 2140 tonnes in 2020. Weights are in tonnes.

Management plan	Target range FMSY upper to FMSY  0.26–0.43		Consistent with the ranges resulting in no more than 5% reduction in long-term yield compared with MSY.	ICES (2019a)
	Target range F <sub>MSY</sub> to F <sub>MSY lower</sub>	0.18-0.26	Consistent with the ranges resulting in no more than 5% reduction in long-term yield compared with MSY.	ICES (2019a)

## Basis of the assessment

**Table 8** Cod in subdivisions 22–24, western Baltic stock. Basis of the assessment and advice.

ICES stock data category	1 ( <u>ICES</u> , 2018).
Assessment type	Age-based analytical assessment SAM (ICES, 2019b) that uses catches (landings, discards, and recreational catch) in the model and in the forecast.
Input data	Commercial catches (landings, age distributions from catch sampling) and recreational catch (Germany, Sweden, and Denmark). Annual stock separation key (from commercial catches) to split catches in Subdivision 24 into eastern and western Baltic cod, derived from otolith shape analyses combined with genetics (this key is available for 19 of the 34 years in the present time-series). The allocation of catches to stock for the remaining years was performed by interpolation. Three survey indices (FEJUCS (age 0), BITS-Q1, and BITS-Q4); annual maturity data from BITS-Q1 surveys. Natural mortalities for age 1 derived from multispecies assessment, unchanged since 1996.
Discards and bycatch	Included in the assessment since 1994, data series from the main fleets.
Indicators	None.
Other information	Benchmarked in 2019 (ICES, 2019a). The basis for the assessment changed in 2015 to being for the western Baltic cod stock, whereas assessments in earlier years were for the area of subdivisions 22–24.
Working group	Baltic Fisheries Assessment Working Group ( <u>WGBFAS</u> )

## Information from stakeholders

There is no additional available information.

# History of the advice, catch, and management

<sup>\*</sup> Includes landings from October to December 1990 of Federal Republic of Germany.

<sup>\*\*</sup> Including landings of Below Minimum Conservation Reference size (BMS) from logbooks

# Summary of the assessment

Table 13 Cod in subdivisions 22–24, western Baltic stock. Assessment summary. Weights are in tonnes. Recruitment in thousands. High and Low refer to 95% confidence intervals.
